

Background study for MMT-DY process at SPD

A.N.Skachkova
(JINR, Dubna)

V.A. Matveev, R.M. Muradian, A.N. Tavkhelidze (MMT)

(V.A. Matveev, R.M. Muradian, A.N Tavkhelidze, JINR-P2-4543, JINR, Dubna, 1969; SLAC-TRANS-0098, JINR P2-4543, Jun 1969; 27p.)

process, called also as Drell-Yan

(S.D. Drell, T.M. Yan, SLAC-PUB-0755, Jun 1970,12p.; Phys.Rev.Lett. 25(1970)316-320, 1970)

The dominant mechanism
of the l^+l^- production is
the perturbative QED/QCD
partonic $2 \rightarrow 2$ process

$$\bar{q}q \rightarrow \gamma^* / Z^0 \rightarrow l^+l^-$$

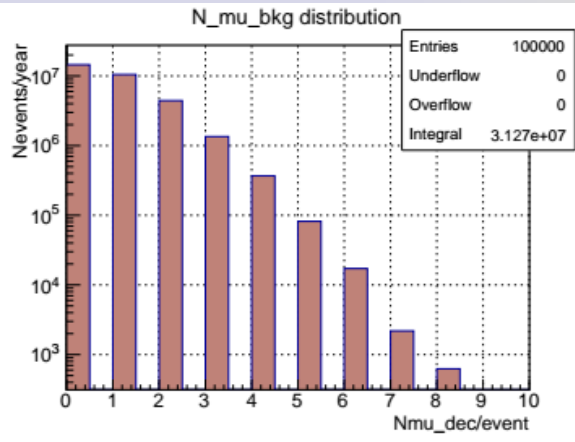

$$\sigma = 9.9 * 10^3 \text{ pb}$$

PYTHIA 6.4 simulation for the $E_{\text{cms}} = 27 \text{ GeV}$

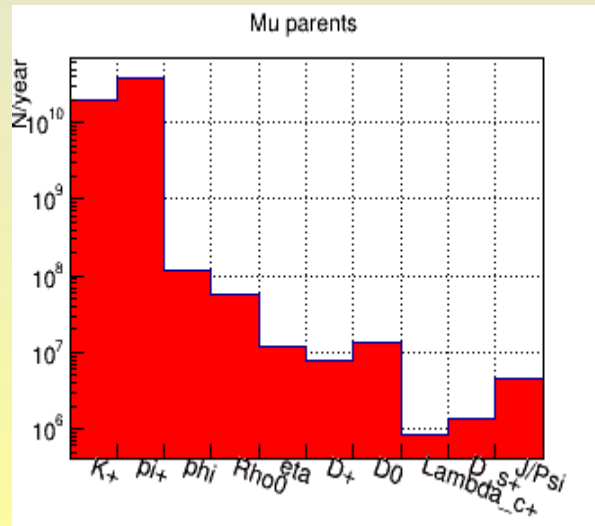

For the Luminosity $L = 1 \times 10^{32} \text{ cm}^{-2}\text{s}^{-1}$ with assumption of the full year beam operation
we expect up to 3.1×10^7 Drell-Yan events/year

Background muons in signal events

53.5 % of signal events contains >2 muons
- up to 8 μ /event

We allow particles decay (and produce muons) in the volume before Muon (Range) System :
cylindr radius **R = 2 400 mm**,
size from the centre along Z axis **L = 4 000 mm**
and search for muons in the angle region **9° < Θ < 171°**

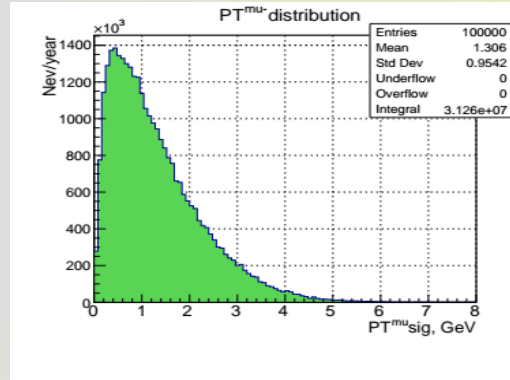

The most probable parents of bkg muons - are charged π and K

The most probable grandparents of bkg muons - are «string» (Lund model), $\rho^0, \rho^+, K_s^0, K^{*0}, K^+, \eta'$

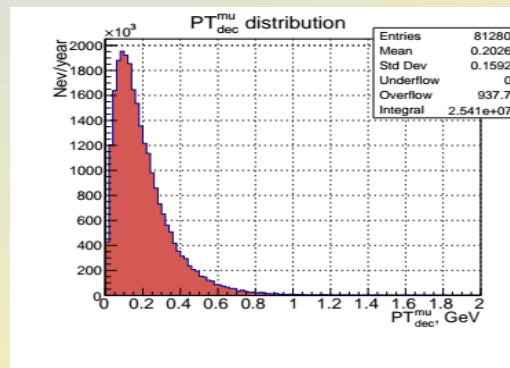

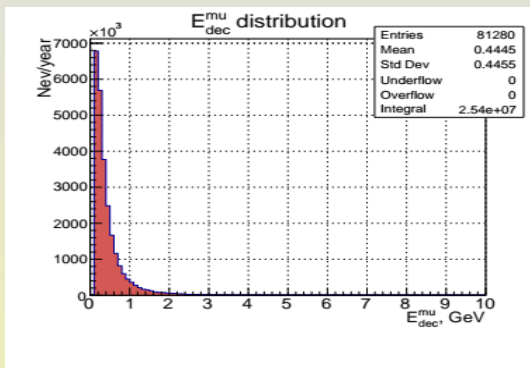

Decay muons in signal events

E
C

D
E
C
(
log)

Cuts : exactly 2 muons	E > 0.8 GeV PT > 0.4 GeV	E > 1.0 GeV PT > 1.0 GeV
Reminder of signal events	54.1%	23.5%
Fraction of initial signal events with additional muons	2.1%	0.08%
Fraction of remaining signal events with additional muons	3.9 %	0.3%

Another situation when we have exactly 2 μ — first signal, the second — survived fake one.

We have 2 situations -

1. Muons are of the same sign — easy to cut off
2. Muons are of different signs

After cutting off the events with additional (>2) muons we have

Cuts: exactly 2 muons with opposite signes	E > 0.8 GeV PT > 0.4 GeV	E > 1.0 GeV PT > 1.0 GeV
Reminder of signal events	51.9%	23.4%
Fraction of initial signal events with fake muons of the same sign	0.9%	0.09%
Fraction of remaining signal events with muons of the same sign	1.7 %	0.4%
Reminder of signal events after cut off the events with the muons of the same sign	51.0%	23.4%
Fraction of initial signal events with fake muons of different sign	0.9%	0.1%
Fraction of remaining signal events with muons of different sign	1.8 %	0.4%

Here we consider 2 kinds of backgrounds: QCD and Minimum-bias events

The generation was done with the use of more than 20 QCD subprocesses existed in PYTHIA

The main contributions come from the following partonic subprocesses:

- $q + g \rightarrow q + g$ (gives 2.8% of events with the $\sigma = 4.83$ mb);
- $g + g \rightarrow g + g$ (gives 2.5% of events with the $\sigma = 4.31$ mb);
- $q + q' \rightarrow q + q'$ (gives 0.7% of events with the $\sigma = 1.17$ mb);

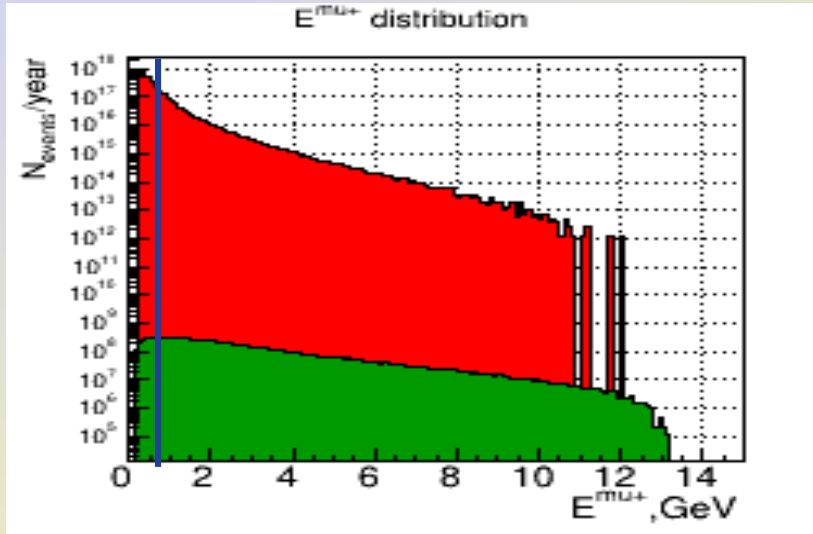

For QCD background $S/B \approx 10^{-6}$

The main source of background for the $\bar{q} q \rightarrow \gamma^* \rightarrow \mu^+ \mu^-$ are the Minimum-Bias processes:

- *Low - PT scattering* (gives 65% of events with the $\sigma = 13.0$ mb);
- *Single diffractive* (gives 22.3% of events with the $\sigma = 7.35$ mb);
- *Double diffractive* (gives 6.4% of events with the $\sigma = 2.12$ mb);
- $\bar{q} + q \rightarrow l^+ + l^-$ (has 0.000028% of events with the $\sigma = 9.9 \times 10^{-6}$ mb);

For Mini-bias background $S/B \approx 3 \times 10^{-7}$

First cuts — on E and PT

Effective cut off on E(P) only in the region $E_{bkg}^{\mu} < 1.5 \text{ GeV}$ ($E_{bkg}^{\mu} = 0.8 \text{ GeV}$) where is the maximum gradient in E_{bkg}^{μ} distribution

The most effective cuts off are in the region $PT_{bkg}^{\mu} < 1.5 \text{ GeV}$ ($PT_{bkg}^{\mu} = 0.4 \text{ GeV}$)

Invariant mass cut

The most effective cut is in the region **< 0,9 — 1 GeV**.

Further increase of M_{inv} cut has no sense for Minimum-bias background events (it leads to significant loss of signal events without real improvement of S/B ratio) except backgrounds in the regions of J/Ψ and other resonances production.

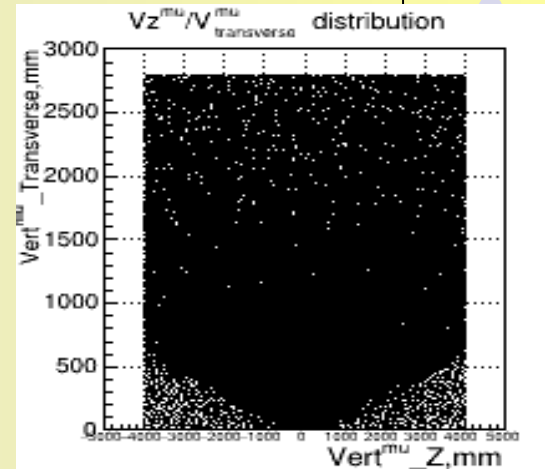

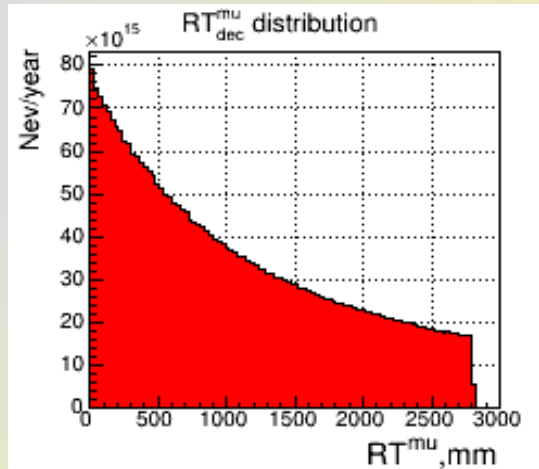

Together with the cut $E, P_T > 1 \text{ GeV}$

Supposing 100 % - without Minv cut

M_{inv} cut	Rest of BKG	Cut efficiency	Rest of sig	Cut efficiency	S/B
$M_{inv}^{\mu\mu} > 0.9 \text{ GeV}$	76.7 %	1.3	100 %	1	0.038
$M_{inv}^{\mu\mu} > 1.0 \text{ GeV}$	73.8 %	1.35	99.4 %	1.006	0.039
$M_{inv}^{\mu\mu} > 1.5 \text{ GeV}$	64.4 %	1.55	39.2 %	2.55	0.021
$M_{inv}^{\mu\mu} > 2.0 \text{ GeV}$	55.8 %	1.79	21.1 %	4.73	0.013
$M_{inv}^{\mu\mu} > 2.5 \text{ GeV}$	35.9 %	2.78	12.6 %	7.9	0.010
$M_{inv}^{\mu\mu} > 3.0 \text{ GeV}$	19.7 %	5.06	7.6 %	13.1	0.014
$M_{inv}^{\mu\mu} > 3.5 \text{ GeV}$	9.7 %	10.3	4.5 %	21.9	0.019
$M_{inv}^{\mu\mu} > 4.0 \text{ GeV}$	5.2 %	19.1	2.7 %	36.7	0.018
$M_{inv}^{\mu\mu} > 4.5 \text{ GeV}$	3.1 %	31.6	1.6 %	61.6	0.030
$M_{inv}^{\mu\mu} > 5.0 \text{ GeV}$	2.0 %	48.5	1.0 %	101.5	0.046

Vertex distributions

$$R = \sqrt{(x^2+y^2+z^2)}$$

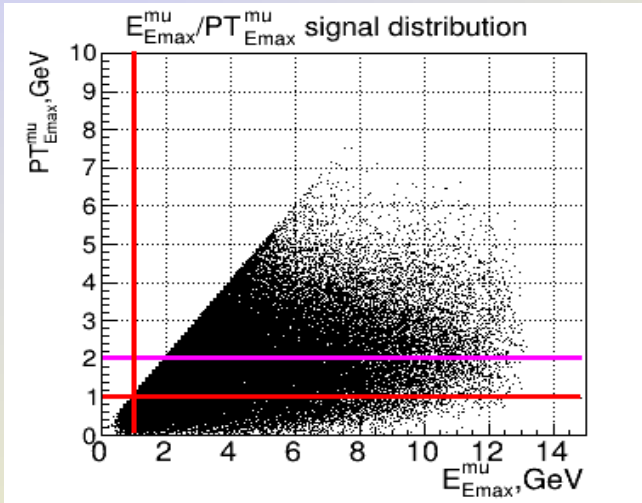

$$RT = \sqrt{(x^2+y^2)}$$

E_{PTmax}^{μ} - energy of leading μ with max PT

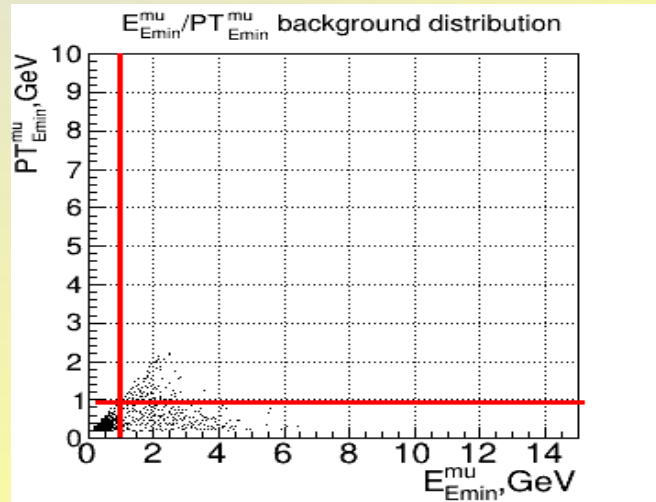

E^μ/PT^μ correlations for muons with max(fast)/min(slow) E^μ in the pair

S
I
G

B
K
G

$PT_{E_{max}}^\mu > 2.0 \text{ GeV}$ can also be considered

Cut on $PT_1 > 1.0 \text{ GeV}$ and $E_\mu > 1.0 \text{ GeV}$

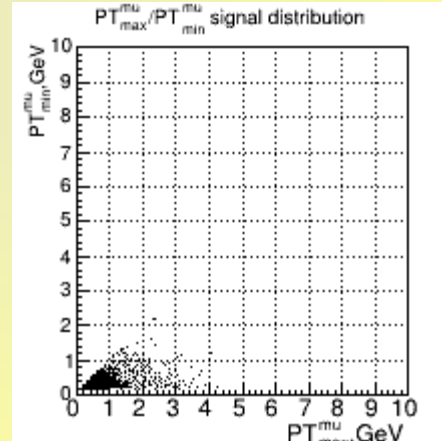

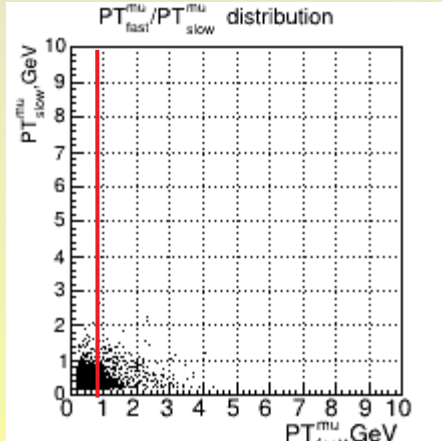

$E_{\max}(\text{fast})/E_{\min}(\text{slow}), PT_{\text{fast}}/PT_{\text{slow}}$ $PT_{\text{max}}/PT_{\text{min}}$ distributions

S
I
G

B
K
G

Proposed cuts

1. Events with only 2 muons with $PT_l > 1.0 \text{ GeV}$,
 $E_l > 1.0 \text{ GeV}$ ($PT_l > 0.4 \text{ GeV}$, $E_l > 0.8 \text{ GeV}$ &
 $PT_{E_{\max}}^\mu > 1.0 \text{ GeV}$)
2. Muons are of the *opposite sign*
3. $Minv(l^+, l^-) > 0.9 \text{ GeV}$
4. The vertex of origin lies within the
distance from the interaction point $< 1 \text{ mm}$
5. Isolation criteria $E_{(R \text{ isolation} = 0.2)}^{\text{sum}} > 0.5 \text{ GeV}$

The plots show the distributions over **summarized energy** of the final state charged particles in the cones of radius $R_{\text{isolation}} = \sqrt{\Delta\eta^2 + \Delta\phi^2}$ respect to the (η - pseudorapidity, ϕ — azimuthal angle)

upper plot **signal events**

bottom plot **Mini-bias background**

Isolation criteria ($R_{\text{isolation}} = 0.2$)

E (of particles) > 0.5 GeV

allows to separate most part of Mini-bias & QCD bkg muons with the loss of **0.7 %** of signal events

after applied 4 cuts discussed above
