Mar 26, 2025

2025

Plans for the Presentation

- Introduction
- Physics goals and detector system
- Focus on nucleon spin structure
- Measurements, expectations, challenges
- Status and schedule of SPD
- Summary

Spin Physics Detector (SPD) at NICA

- Polarized collisions
 - $p^{\uparrow}p^{\uparrow}$ up to $\sqrt{s} = 27$ GeV • $d^{\uparrow}d^{\uparrow}$ up to $\sqrt{s} = 13.5$ GeV
- Beam polarization $|P| \sim 70\%$

Figure 1: NICA - Nuclotron-based Ion Collider fAcility at the Joint Institute for Nuclear Research (JINR) at Dubna

Prime focus at SPD : parton distribution functions (PDFs) of gluons

Figure 2: Luminosity and bunch intensity : SPD TDR

(4) (E) (E)

SPD Kinematics

Figure 4: Kinematic coverage for major probes at the SPD : charmed mesons, high- p_T photons and charmonia : CDR

 <li

A sample of the physics topics that will be probed at Stage-I of SPD :

- Spin effects in pp, dd (quasi-)elastic scattering
- Charmonium production near threshold
- Strange hypernuclei production
- Spin effects in hyperon production
- Spin structure of multi-nucleon short-range correlations
- Fluction-fluction interactions and di-baryon production

SPD Stage I : Detector

Figure 5: SPD detector in Stage I : SPD TDR

- Trackers:charged track and momentum, limited PID through energy deposition
- Range System:hadronic calorimeter, muon/hadron separation

- Up to $\sqrt{s} = 10$ GeV and reduced luminosity
- Solenoidal field $B \sim 1 \text{ T}$
- BBC and ZDC for online polarimetry
- Micromegas central tracker
- Straw Tracker $\delta \sim 240 \ \mu m$, $\delta(\frac{dE}{dx}) = 8.5\%$

Amaresh Datta (JINR) (On behalf of the SPStudying Nucleon Spin Structure at the Spin

▲ ■ ▶ < ■ ▶

 Mar 26, 2025

SPD Stage II : Physics

- Primary focus : accessing gluon PDFs
 - Unpolarized gluon PDF
 - Oluon helicity PDF
 - Gluon transverse momentum dependent (TMD) PDF (Sivers, Boer-Mulders)
 - Transversity and tensor polarized gluon in deuteron (unique result at SPD)
- Test of QCD factorization
- Charmonia production mechanism

7/33

N 4 E N

Mar 26, 2025

SPD Stage II : Detector

Figure 6: SPD detector in stage II : SPD TDR

- Improved vertex detector for short lived particle decays
- TOF+FARICH for better PID
- ECAL for γ, e^{\pm} identification

• Event rate at peak luminosity and energy $\sim 3 \text{ MHz}$

- Silicon vertex detector : MAPS/DSSD
- Electromagnetic calorimeter (ECAL) $\left(\frac{\delta_E}{E} = \frac{5\%}{\sqrt{E}} + 1\%\right)$
- Time of flight (TOF) for PID ($\delta_t \sim 50$ ps), π/K separation upto 1.5 GeV/c
- Focusing RICH in end-caps, extend π/K separation upto 5.5 GeV/c

Amaresh Datta (JINR) (On behalf of the SP<mark>Studying Nucleon Spin Structure at the Spin</mark>

Detector Performances

- Clockwise from lower left (SPD TDR) :
- Resolution of reconstructed D^0 vertex : $\delta_z \sim 50 \ \mu {\rm m}$ for MAPS
- Invariant mass of 2-photons : $\delta_m^{\pi^0} \sim 10 \ {\rm MeV}$
- TOF performance:provides a 3σ separation of π/K up to 1.5 GeV/c
- Additionally:in the straw tracker, $\frac{\delta_{PT}}{PT} \sim 2\%$ for 1 GeV/c tracks (magnetic field ~ 1 T)

Probing Gluon Spin Distributions at the SPD

	Unpolarized	Circular	Linear
Unpolarized	g(x)		$h_1^{\perp g}(x,k_T)$
	density		Boer-Mulders function
Longitudinal		$\Delta g(x)$	Kotzinian-Mulders
		helicity	function
Transverse	$\Delta_N^g(x,k_T)$	Worm-gear	$\Delta_T g(x)$
	Sivers function	function	transversity (deuteron only),
			pretzelosity

Figure 7: Various spin distributions of gluons that will be accessible via cross-section and asymmetry measurements at the SPD

- Unpolarized gluon distributions
 (g(x))
- Gluon helicity PDF $(\Delta g(x))$
- TMD gluon spin distributions i.e. Sivers $(\Delta_N^g(x, k_T))$, Boer-Mulders $(h_1^{\perp g}(x, k_T))$
- Transversity $(\Delta_T g(x))$: deuteron

Gluon Helicity $\Delta g(x)$

Figure 8: Gluon helicity distribution from DSSV group: Phys. Rev. D 100 114027(2019). Highlighted region shows where SPD will make a major impact

Figure 9: Truncated moments of $\Delta g(x)$ illustrate SPD impact on high-x and future EIC impact in low-x region

Gluon TMD : Sivers

Figure 10: Extracted [above : Phys. rev. D 102, 054002, below : EIC white paper] quark Sivers as functions of x and k_T

- Sivers function can be described as a correlation between parton k_T and hadron transverse spin
- Transverse single spin asymmetries (*A_N*) are sensitive to the gluon Sivers function
- Extracted in generalized parton model(GPM), color gauge invariant GPM(CGI-GPM) descriptions of partonic structure
- Unlike gluon helicity PDF, there has not been extraction of gluon Sivers from global analysis, SPD can provide much needed data points

Amaresh Datta (JINR) (On behalf of the SPStudying Nucleon Spin Structure at the Spin

SPD : Prominent Measurements

Figure 11: Partonic sub-process cross-sections from p + p vs. collision energy : SPD CDR

Figure 12: Sub-process diagrams

- Flagship probes at SPD accessing gluon content :
 - **gluon fusion to charmonia** $(J/\Psi, \Psi(2S), \chi_{c_1/c_2})$, primarily via dimuon decay channel
 - Quark-gluon to prompt-photons, cleanest channel for interpretation
 - gluon fusion to open-charm mesons, highest statistics but also very high background

Various SPD Probes

	$\sigma_{27\text{GeV}}$,	$\sigma_{13.5\text{GeV}}$,	$N_{27{ m GeV}},$	$N_{13.5{ m GeV}}$
Probe	nb (×BF)	nb (×BF)	10^{6}	10^{6}
Prompt- $\gamma (p_T > 3 \text{ GeV/c})$	35	2	35	0.2
J/ψ	200	60		
$ ightarrow \mu^+\mu^-$	12	3.6	12	0.36
$\psi(2S)$	25	5		
$ ightarrow J/\psi\pi^+\pi^- ightarrow\mu^+\mu^-\pi^+\pi^-$	0.5	0.1	0.5	0.01
$ ightarrow \mu^+\mu^-$	0.2	0.04	0.2	0.004
$\chi_{c1} + \chi_{c2}$	200			
$ ightarrow \gamma J/\psi ightarrow \gamma \mu^+\mu^-$	2.4		2.4	
η_c	400			
$ ightarrow par{p}$	0.6		0.6	
Open charm: $D\overline{D}$ pairs	14000	1300		
Single D-mesons				
$D^+ \rightarrow K^- 2\pi^+ (D^- \rightarrow K^+ 2\pi^-)$	520	48	520	4.8
$D^0 \to K^- \pi^+ (\overline{D}^0 \to K^+ \pi^-)$	360	33	360	3.3

Figure 13: Expected statistics for probes for one year of data at SPD

Amaresh Datta (JINR) (On behalf of the SPStudying Nucleon Spin Structure at the Spin

Charmonia Measurements

Figure 14: Above: Range System at SPD Below: di-muon invariant mass spectra for J/Ψ : SPD TDR

- Productions are dominated by gg fusion at SPD kinematics
- Reconstructed from di-muon decay channels using Range System as muon identifier
- Hadronization poorly understood (various models : CSM, CEM, NRQCD)
- TMD factorization not always applicable
- J/Ψ most abundant ~ 12 M events expected in one year of data in this channel

J/Ψ Double Helicity Asymmetry $(A_{LL}^{J/\Psi})$

G² 0.05 0.045 0.045 0.045 0.045 0.05 0.05 0.02 0.02 0.05 0.05 0.05 0.05 0.05 0.05 0.05 0.05 0.05 0.045 0.0

Figure 15: Estimated $A_{LL}^{J/\Psi}$ for different PDF replicas (brown and green bands are uncertainties for scale and LDME variations) : Physics 2023, 5(3), 672-687

•
$$A_{LL}^{J/\Psi} \approx \frac{\Delta g(x_1)}{g(x_1)} \otimes \frac{\Delta g(x_2)}{g(x_2)} \otimes \hat{a}_{LL}^{gg \to J/\Psi + x}$$

- Sensitive to gluon helicity PDF
- SPD kinematic will probe *x_{Bjorken}* ~ 0.03 - 0.5

Figure 16: Projected statistical uncertainties for $A_{LL}^{J/\Psi}$ measurements from one year of recorded data at the SPD in p_T for three different selection criteria of muon polar angle θ_{μ} : SPD CDR

Impact of SPD $A_{LL}^{J/\Psi}$ Measurements

Figure 17: Estimated impact of $A_{LL}^{J/\Psi}$ measurements at the SPD on the gluon helicity distribution $\Delta g(x)$. Blue and red lines show the mean of the NNPDFpol1.1 replica sets before and after the re-weighting, respectively. Light blue and light orange bands show the corresponding standard deviation uncertainties (Physics 2023, 5(3), 672-687).

SPD impact in $0.1 \le x \le 0.6$ range

Mar 26, 2025

J/Ψ Single Transverse Spin Asymmetry $(A_N^{J/\Psi})$

Figure 18: $A_N^{J/\Psi}$ predictions for SPD kinematics (and projected uncertainties for one year of recorded data) [Phys. Rev. D *104*, 016008]

- Top to bottom : GPM and CGI-GPM. Left to right : SIDIS1 and D'Alesio parameterization of Sivers Function
- Various combinations of PDFs and hadronization models illustrate strong model dependence
- For example, asymmetry predictions using SIDIS1 and d'Alesio params. are different by an order of magnitude
- SPD measurements and precision can be crucial in restricting such model dependence in future

Other Charmonia Probes

Figure 19: Di-muon invariant mass spectra for various charmonia probes : SPD CDR

- $\Psi(2S)$ via di-muon decay channels ($\mu^+\mu^-\pi^+\pi^-$, $\mu^+\mu^-$) : ~ 700 K events/year
- χ_{c1}, χ_{c2} via di-muon decay channel ($\gamma \mu^+ \mu^-$) : ~ 2.4 M events/year
- Double J/Ψ productions : both J/Ψ into di-leptonic decay channels ~ 100 events/year
- Limited η_c measurements could also be possible (of special ineterest as TMD factorization is proven for this probe)

Prompt Photon Double Helicity Asymmetry (A_{LL}^{γ})

Figure 20: Predictions of A_{LL}^{γ} as function of transverse momentum p_T (Physics 2023, 5(3), 672-687)

Estimates (right plot) show that measurements at the SPD can reduce uncertainties of gluon heicity at large x by $\frac{F}{2}$ $\sim 1/2$

of gluon heicity at large x by Figure 21: Impact of SPD A_{LL}^{γ} (Physics 2023, $\sim 1/2$ 5(3), 672-687) : Vogelsang, Sassot, Borsa

Prompt Photon Transverse Single Spin Asymmetry (A_N^{γ})

Figure 22: Above: Predicted A_N^{γ} vs. x_F from V. Saleev, A. Shipilova with projected uncertainties for one year of data at SPD Below: Estimation of uncertainty due to background : SPD CDR

- Prompt photon is an excellent channel to probe gluons as it does not include hadronization
- Challenge to remove stray photons from neutral light meson decays
- Uncertainties arising from photons from π^0 decays are estimated as systematic on lower left plot

Open Charm Measurements

Figure 23: Above: inclusive D^0 , $\overline{D^0}$ cross-section prediction (A. Karpishkov), Below: Projected π -K invariant mass spectra for one year of data at the SPD

Figure 24: Predicted A_N at SPD kinematics (Prog. Part. Nucl. Phys. 2021, 119, 103858)

- Productions dominated (up to 70%) by gluon fusion
- Sensitive to gluon spin distributions
- Expected high A_N at $x_F \ge 0.2$
- Challenging measurement due to very high background $(B/S \sim 10^5)$

・ロト ・ 同ト ・ ヨト ・ ヨト

Neutral D Transverse Single Spin Asymmetry at the SPD

Figure 25: Above: Projected π -K invariant mass spectra after selection criteria are applied Below: $D^0 \rightarrow \pi^+ K^-$ fit to signal and background

Figure 26: Predicted inclusive A_N^D at SPD kinematics with projected statistical uncertainties δ_N^{stat} for D^0 (Physics 2023, 5(3), 672-687)

Expected statistical precision should be able to (dis)favour GSF models decisively

The SPD : An International Collaboration

Figure 27: Members at the most recent SPD Collaboration Meeting. More than 400 members from 10 countries and growing.

SPD Tentative Schedule

- Detector development and testing are on track for the first phase of the SPD
- Due to quite different luminosity and multiplicity requirements, SPD and MPD typically will operate consecutively at NICA rather than concurrently

Mar 26, 2025

・ロト ・ 同ト ・ ヨト ・ ヨト

Summary and Outlook

- Spin Physics Detector (SPD) at the NICA facility will be a unique facility focusing on the unpolarized and polarized gluon distributions inside protons and deuterons from p + p and d + d collisions up to $\sqrt{s} = 27$ and 13.5 GeV respectively
- In the first stage, SPD will probe several interesting unpolarized and spin-dependent effects from p + p and d + d at low ($\sqrt{s_{NN}} = 5 10$ GeV) energies
- In the final stage, SPD measurements (of charmonia $(J/\Psi, \Psi(2S), \chi_c)$, prompt-photon and open-charm (D mesons)) will be sensitive to
 - unpolarized gluon PDF
 - 2 gluon helicity
 - gluon TMD (Sivers, Boer-Mulders)
 - gluon transversity in deuteron
- SPD contributions to the polarized gluon distributions will be complementary to similar existing and future collider (RHIC, EIC) and fixed target (AFTER, LHC-Spin) experiments

Bayesian Re-weighting

- Each data point is used with its error (assumed Gaussian) to create MC replicas in the multi-Gaussian data space (virtual ensemble of data sets)
- PDF sets (u,d,s, anti-quarks, g etc.) are extracted from EACH data replica
- The average gives the central value and the standard deviation is the natural uncertainty of the PDF

Figure 29: Phys. Rev. D 100, 114027 (2019)

Mar 26, 2025

31/33

Amaresh Datta (JINR) (On behalf of the SPStudying Nucleon Spin Structure at the Spin

Re-weighting Technique to Quantify Impact of New A_{LL}

- Once extracted, the set of replica PDFs can be used to measure the impact of a new asymmetry measurement WITHOUT doing full global analysis again
- "The Bayesian reweighting is fully equivalent to a refit including the additional set of data ..."
- Example shows the impact of STAR mid rapidity dijet result on the central value and the uncertainty band of the gluon helicity

Figure 30: Phys. Rev. D 100, 114027 (2019)
